# The European Crisis in the Context of the History of Previous Financial Crises

Michael Bordo and Harold James

A comment by Nicos Christodoulakis

### **Shortcomings of the interwar Gold Exchange system:**

- 1.No central coordination

  League of Nations was a very weak policy institution
- 2.No credit provision mechanism for countries in stress The asymmetry problem: Over- and Under-acummulation,
- 3.No central concern with recession and unemployment Social tensions multiplied beyond control

Consequences: Financial, economic, social, political

## How much recovery after abandoning the Gold Exchange System?

### A layman's test:

Check how much GDP improved within 2-years after leaving GES, as opposed to 2-years prior of devaluation

Use Maddison GDP series of 1990 US Dollars

·For the periphery: Surprisingly little

•For the core countries: More improvement, but...

Not for all, not quickly

## **Countries leaving GES:**

Wandschneider (2008), Bernanke and James (1991), Eichengreen (1992).

## Why periphery failed after abandoning the GES?

**□** No export-led growth

Industry: few comparative advantages

Agriculture: few exportables

Protectionism on the rise everywhere

- □ Peripheriality: Thin domestic market
- □ Strong employment hysteresis
- □ No loan facilitation: Credit remained stagnant
- Weak institutions led to social unraveling and political fragmentation

#### The vicious feedback

- 1. Sudden stop in credit provision:
- **→** Countries forced to repudiate external debt
- **→**Further exclusion from the financial markets (for some countries for decades)
- 2. Thin domestic markets 

  Very low borrowing ability

Result: Financial asphyxia

→ Perpetuation of the "sudden" stop

## Greece: Exch Market Pressure unabated after the collapse

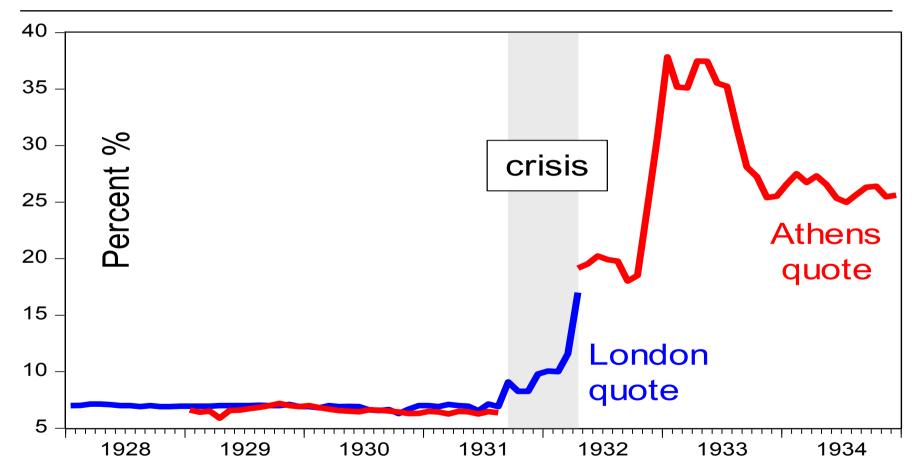

**Eichengreen, Rose and Wyplosz (1995)** 

#### Sovereign bond yields soared long after devaluation

**Source:** Athens: average yield of bonds, various issues

London: Global Financial Data, GFD

In fact, Greece returned to the international bonds market only in 1998!

## Periphery mainly under autocratic regimes

**Poland**

**→→** Repression

## Periphery mostly suffered

Peripheral economies did not confirm the prevailing view that

"abandoning exchange rate stability automatically results to recovery and more employment".

This happened in core economies, not in the periphery.

Keynes: the currency liberation from the "golden fetters"

For the periphery, it was perhaps the imposition of the <u>"iron fetters"</u> that made unemployment to decline and output to grow

#### Lessons

Asymmetry: Now ECB

Credit stagnation: Bridge financing (ESM)

**Bail-outs** 

(though belated, and recessionary)

Peripheriality: Cohesion funds, now too little

Social impact: Verbal concern. Poor record.
